

CONTEXTUALIZING THE RENDER: GENERATIVE FILL

An architectural visual is never just about the building; it is about the life, context, and environment that surround it. Generative AI allows us to rapidly prototype how a single space might feel across different scenarios, but it requires intentional prompt engineering to avoid repetitive, generic, or biased results. In this exercise, we will focus exclusively on **Adobe Firefly's Generative Fill** tool to inject diversity and narrative variety into your existing visuals.

Select one or two base visual of a project you have created (e.g., an exterior perspective, an interior view or bird's eye view). Using *only* the Generative Fill feature in Adobe Firefly, you will produce distinct variations of this single base image.

Your goal is to demonstrate maximum diversity across these variations by altering the surrounding context. You must explore:

- 1. **Diverse Representation:** Populating the scene with people of varying ages, cultures, abilities, and activities to avoid standard "render ghost" stereotypes.
- 2. **Environmental / Contextual Variety:** Changing the season, time of day, landscaping, or surrounding urban fabric (e.g., transforming a generic plaza into a vibrant community market, or a sterile interior into a lived-in space).

STEP 1
DIVERSITY

Populate the scene with individuals of varying ages, cultures, and abilities to avoid standard "render ghosts."

STEP 2
CONTEXT

Alter the season, time of day, landscaping, or urban fabric to transform generic spaces into active, lived-in environments.
